Comments:

I'm satisfied that the core location-based search is working well.

The visual design of the app is really well thought out, and the code is well structured. You could, perhaps, have refactored the networking code to reduce duplication between the search types, but this is a minor criticism.

The additional search types seem to be functioning fine, with no significant problems.

Google Maps is working really well, and I'm very pleased with it. The de-clustering is a particular highlight.

It would have been nice to have seen some progress made towards Threading, with an AsyncTask to handle the fetching of data from the server.

Overall, I'm very happy with this submission. You've achieved a lot here, and you can rightfully be proud of the result.
